

AIE1901: Large Language Models for Social Simulations

Mid-term Group Presentation — Option B

School of Artificial Intelligence, The Chinese University of Hong Kong, Shenzhen

Deliverables

Submit: Submit a single ZIP named: `AIE1901_Midterm_OptionB.zip`

Deliverables inside ZIP:

- `slides.pdf` or `slides.pptx`
- `video.mp4` or a link in `README.txt`
- (optional) code excerpts and `README.md` with reproducibility details

Purpose

This mid-term presentation is designed for **Option B** group, which is a more challenging and exploratory path. It builds upon the classic research work “*Generative Agents: Interactive Simulacra of Human Behavior*” (*Stanford Town*), a study that introduces an architecture combining large language models with memory, reflection, and planning mechanisms to simulate realistic individual and group behaviors in a sandbox environment.

Your task is to present a deep understanding of the *Stanford Town* framework and your group’s exploration of it. The presentation should combine theoretical understanding, implementation analysis, and experimental insights.

Your Presentation Should Cover

The Option B group should prepare a comprehensive slide deck (no page limit) addressing the following key components:

1. Overview

- Introduce the background and motivation of the paper.
- Explain the main objectives: how the authors simulate social behavior through LLM-based agents.

2. Methodology and System Architecture

- Describe the architecture of the simulation — how memory, reflection, and planning modules interact with the language model.
- Explain how agents perceive, store, and retrieve information.
- Show diagrams (either from the paper or your own) illustrating the system flow.

3. Code Structure and Implementation Analysis

- Provide an overview of the code repository or implementation you studied or adapted.
- Explain the purpose of each major module or file.
- Discuss how these modules work together during simulation.

4. Experimental Setup and Results

- Summarize the main experiments conducted in the paper.
- Explain what kinds of emergent behaviors or social patterns were observed.

5. Insights and Reflections

- What did you learn from studying or experimenting with the Stanford Town system?
- What limitations, challenges, or open questions did you identify?
- How might similar architectures evolve in future social simulations?

Short Video (≤ 3 minutes)

In addition to the slides, produce a short video summary. This can take one of two forms:

- **Mini Presentation:** A concise talk presenting the highlights of your analysis and results.
- **Edited Summary Video:** A short, well-edited video combining simulation visuals, narration, and key findings.

Requirements:

- Length: ≤ 3 minutes.
- Must contain substantive content (not just general introductions).

Assessment Rubric (100 pts)

Criterion	Description	Points
Conceptual Integration	Clear linkage of the Stanford Town research, architecture, and experiments into a cohesive story	25
Methodology & Architecture Analysis	Depth, correctness, and insightfulness of your explanation of memory, reflection, and planning mechanisms	20
Experimentation & Results	Clarity, organization, and analytical depth in presenting experimental setups and outcomes	20
Code Analysis	Conciseness, informativeness, and accuracy in explaining code structure and module functions	20
Professionalism	File naming and formatting	15
